#### Description

#### Use case BMO-1b: Register an extension of an asset (register, register item) in the federation

This use case assumes separate registers for assets and extensions in the federation's register of registers.

Name	Register an extension of an asset (registry, register, register item) in the federation
Primary Actor	The manager of a national or thematic register or registry.
Goal	Make the asset extension known in the federation.
Importance	high
Description	The register/registry manager submits a description of the asset extension to the federation's register of registers.
Pre-Condition	Information about the asset (registry, register, register item) is available in the federation's register of registers.
Post-Condition	Information about the asset extension is available in the federation's register of registers.

Step 1	The register/registry manager compiles the metadata on the asset extension necessary for registration. The description should include at least a unique id, the id of the asset being extended and the id of the extension.
Step 2	The register/registry manager submits the metadata on the asset to the federation's register of registers. The information could be submitted through a management user interface or an API.
Step 3	The federation registry creates a register item for the asset extension in the register of registers.
